

SAFETY AND SECURITY

As trusted connectivity suppliers to over 90% of the UK Military, safety and security come as standard for all our customers.

We are Cyber Essentials Plus certified and covered by our ISO27001-accredited Information Security Management System. So whether you customers are handling sensitive military documents or simply logging in to your bank account, the data is protected with industry-leading security.

Next-Generation Firewalls

All traffic passes through next-generation firewalls and is subject to intelligent threat detection, protecting users from viruses, malware, ransomware and phishing attacks.

Protected Access

Users can only access the network using firewalls and RSA token 2-Factor authentication from known and trusted locations.

Proactive Network and Security Monitoring

Our Network Operations Centre and Security team proactively monitor our networks 24/7, 365 days a year, to protect our users from faults, vulnerabilities, and attacks—backed up by our intelligent threat detection software.

Customisable Security Preferences and Access Controls

We support customisable security preferences and access controls that can be modified for different users and groups, including guests, contractors and visitors.

Users only see what you define and what they need to access to fulfil their role, while administrators always have full visibility and control of network access for complete peace of mind.

wifinity

As connectivity providers, we have a responsibility to protect users and organisations from inappropriate and even illegal content.

We block URLs tagged by the Internet Watch Foundation as containing illegal material in real-time, and you can maintain your own blocked URL list to prevent minors and other customers from accessing inappropriate content on your network.

With military-grade security and proactive and intelligent threat detection, partnering with Wifinity keeps your customers, and their data safe and secure.
